

PREPARED FOR JARON JAGGERS

CMS Roofing & Restoration

3-Phase Growth Plan

Phase 1 Base: data, KPIs & the revenue story

Phase 2 Optimize current systems + AI

Phase 3 Outbound & split testing vs. inbound

Prepared by Charles Sherwood · September 2026

Based on public information. Real figures replace estimates once CMS data is reviewed.

CMS Roofing & Restoration: 3-Phase Growth Plan

Prepared for: Jaron Jaggers

Prepared by: Charles Sherwood · September 2026

Phase	Focus	Weeks	You get
1. Base	Turn the data into a story. Make every KPI known.	1–4	The numbers, a dashboard, and a "State of Revenue" story
2. Optimize	Fix and tune the systems you already have. Add AI wherever it saves time or money.	3–8	Faster leads, working nurture, clean data, AI doing the busywork
3. Expand	Outbound on email + LinkedIn, split-tested against current inbound	7–13+	A second lead engine, measured with the same numbers as inbound

Phases overlap on purpose. Phase 2 starts as soon as Phase 1 shows where the biggest leak is.

Phase 1: Base. Make the data tell a story. (Weeks 1–4)

What I pull

- CRM / job software: every lead, estimate, and job (won, lost, open)
- Marketing spend by channel: ads, HomeAdvisor/Angi, SEO, print, sponsorships, canvassing
- Call logs / call tracking, and the website form inbox
- Invoices / job revenue and job costs (for margin)
- Past-customer list, and the commercial accounts

The KPIs, defined once so everyone uses the same numbers

KPI	Formula	What it answers
CPL: cost per lead	Channel spend ÷ leads from that channel	What does it cost to make the phone ring?
CPA: cost per appointment	Channel spend ÷ inspections held from that channel	What does it cost to get in front of a buyer?
CAC: cost per acquired customer	(Channel spend + sales cost) ÷ signed jobs from that channel	What does a new customer really cost?
Lead → inspection %	Inspections ÷ leads	Is the office converting what comes in?
Close rate	Signed ÷ inspections (by source, by rep)	Are the reps converting?
Average ticket	Revenue ÷ jobs (repair / replace / insurance / commercial)	What's a job worth?

KPI	Formula	What it answers
Gross margin	$(\text{Revenue} - \text{materials} - \text{labor} - \text{subs}) \div \text{revenue}$	What do we actually keep?
LTV: lifetime value	Margin on first job + repeat work (repairs, gutters, siding, maintenance) + margin from referrals	What's a customer worth over time?
LTV : CAC	$\text{LTV} \div \text{CAC}$	Is this channel worth more money? (target 3:1+)
Revenue per lead	Revenue from a channel $\div$ its leads	Stops us optimizing for cheap leads that turn into small jobs
Gross profit per lead	Channel gross profit $\div$ channel leads	Where should the next dollar go? "Every 100 more leads from this source produces about \$X in gross profit."
Pipeline velocity	Days from lead $\rightarrow$ inspection $\rightarrow$ estimate $\rightarrow$ signed $\rightarrow$ installed $\rightarrow$ paid	How fast a lead turns into cash, not just into a sale
Speed-to-lead	Minutes from inquiry to first human contact	Are we losing leads before we talk to them?
Unsold estimate \$	Dollar value of estimates given, not signed	How much money is sitting on the table?
Payback period	$\text{CAC} \div \text{monthly margin per customer (maintenance plans)}$	How fast does recurring revenue pay back?

Production capacity: how much demand can CMS profitably absorb?

Roofing is capacity-constrained. If crews can only install another \$500K this season, generating \$2M of new demand isn't the goal yet.

Metric	What it tells us
Backlog \$ and backlog weeks	Signed work not yet installed, and how many weeks of crew time it represents
Crew capacity	Crews $\times$ install days available per month
Average install duration	By job type (residential, commercial, repair)
Max monthly production \$	The ceiling on what can be installed
Gross profit per crew-week	Which job types make the best use of crew time

Every forecast and every lead target gets checked against capacity. When backlog is full, the system shifts toward higher-margin jobs and maintenance contracts instead of more volume.

Attribution rules (set before any data is pulled)

A dashboard is only as good as its attribution. Say someone clicks a Google ad, doesn't book, sees a Facebook post, and calls six months later to become a \$20K job. Which channel gets credit? We agree on the rules first. Every lead and job record carries:

Field	Field	Field
First-touch source	Lead-generation source (what created the lead)	Opportunity source (what created the inspection)
Campaign / offer / test cell	Rep	Date created
Date contacted	Date inspected	Date quoted
Date won / lost + reason	Revenue	Gross margin

Default rule: **channel ROI uses lead-generation source; first touch is tracked alongside** so we can see what starts journeys versus what closes them. Where old records are missing fields, Phase 1 reports them as "unattributed" rather than guessing.

Turning it into a story

The numbers get turned into answers:

1. **Where the money comes from:** revenue, margin, and LTV by channel and by job type.
2. **Where it leaks:** a funnel waterfall (leads → contacted → inspected → quoted → signed → installed) showing exactly where people drop.
3. **What each channel is worth:** CPL, CPA, CAC, revenue per lead, and gross profit per lead side by side, to decide where to double down and what to cut.
4. **Seasonality & storms:** how much of the year depends on weather, and what that means for cash and staffing.
5. **The forecast baseline:** $\text{leads} \times \text{lead} \rightarrow \text{inspection} \% \times \text{close} \% \times \text{average ticket}$, by month, **capped by production capacity**. This is what Phase 2 and 3 improvements get measured against.

Phase 1 deliverables

- **State of Revenue report**, 5–7 pages written in plain language, walked through together on a video call
- **Live KPI dashboard** (CRM reporting or Looker Studio), updated weekly
- **Weekly one-page KPI summary** with 3 bullets: what moved, why, and what we're doing about it
- **A ranked list of the top 5 revenue leaks**, with a dollar estimate on each. This becomes the Phase 2 priority list.

Phase 1 is done when: every KPI above has a real number, and you agree with the story.

Phase 2: Optimize what you already have. Add AI where it helps. (Weeks 3–8)

The priority order comes from the Phase 1 leak list. Expected work:

Lead forms & capture

- Form rebuilt with address, service type, insurance-claim yes/no, and SMS consent
- Auto-reply on; instant text-back for forms and missed calls
- After-hours and weekend coverage
- Listing cleanup: one name/address/phone everywhere; claim every profile

Nurture sequences (already written; loaded and tuned to CMS's numbers)

- **New lead:** text in seconds, call in 2 minutes, 5-day follow-up; offers two specific times, not a link
- **Lead went cold:** 30-day re-engage
- **Estimate not signed:** 90-day follow-up with financing and proof angles; the "which one is closest?" email
- **Lost / not now:** 6- and 12-month check-ins
- **Past customers:** yearly check-up, post-storm check, referral ask, gutters/siding, warranty reminders
- **Dead database:** a one-time "are you still looking?" message to every old lead

Social presence: fix what prospects will see

LinkedIn company page (commercial buyers, partners, and hires check here, not homeowners):

- **Profile image:** a clean square logo, not the letterboxed version. **Banner:** a commercial job photo plus "Commercial & residential roofing · GAF Master Elite · Versico certified · Bowling Green & Owensboro since 2006".

- **About section and tagline** rewritten for commercial owners, facility managers, and property managers. Add the Owensboro office and the correct phone number.

- **One logo everywhere:** Facebook, LinkedIn, Google, and the website currently don't match.

- **Content shifts from homeowner tips to four audiences, 2 posts a week:**

Audience	What they need to see	Example posts
Commercial / capital-project buyers	Proof you handle big, complex roofs	Commercial job spotlights with square footage, system, and timeline; "repair vs. replace" budget explainers; maintenance-plan results
Partners (realtors, inspectors, insurance agents, GCs)	That you're reliable and fast	Turnaround times, FORTIFIED explainers, partner shout-outs
Hires (crews, estimators, office)	That it's a good family company to work for	Team spotlights, crew wins, safety records, open roles
Community & credibility	Local roots	Awards (WBKO HomePro), sponsorships, milestones like "10,000+ roofs"

- **Personal profiles matter more than the page.** Jaron's profile (and the commercial rep's, once hired) gets a commercial-focused headline and banner, because outbound LinkedIn messages come from people, not the company page.

- Homeowner content stays on Facebook, Instagram, and the Google Business Profile, where homeowners actually are.

Meta (Facebook/Instagram) ads: currently none running. Phase 1 decides whether to test them, based on residential CPL and capacity. If yes, start with three low-risk campaigns:

- **Storm response:** ads targeted to affected zip codes within 24–48 hours of a hail or wind event
- **Retargeting:** people who visited the website but didn't request an inspection
- **Financing:** "roof now, pay monthly" to homeowners in the service area

Prospecting & lead data

- CRM cleaned: duplicates merged, every record tagged by source, job type, segment, and status
- Past customers and old estimates enriched (email, phone, property data) so they can be worked
- Commercial and property-manager lists built from county property records + contact data, ready for Phase 3

AI, wherever it earns its keep

Where	What the AI does	Human stays in the loop for
After-hours & missed calls	AI-assisted call handling answers, captures standardized intake details, identifies urgent situations, and either schedules by CMS's rules or creates a prioritized callback task	CMS sets the rules. Every lead gets a human callback, and urgent ones get it that night.
Call notes	Calls transcribed and summarized straight into the CRM	Reps review the summary
Reply drafting	Drafts responses to leads and outbound replies from the approved reply playbook	A person reads and sends
Lead scoring	Scores leads by job type, property value, roof age, and storm exposure, so the best get called first	The office sets the rules
Estimate follow-up	Personalizes follow-ups using the inspection notes and photos	The rep approves
Review replies	Drafts a reply to every Google review	The owner approves negative-review replies
Content	Turns job photos into Google Business posts, social posts, and case studies	A final look before posting
KPI narrative	Writes the weekly "what moved and why" summary from the dashboard	Charles checks it
Outbound research	Pulls building details and roof age, and drafts Loom talking points	Every claim is verified before it's sent

Guardrail: AI voice is used for answering inbound calls only. Outbound AI voice calls need the person's prior consent under FCC rules, so we don't do them cold. AI is infrastructure here, not a replacement for judgment.

Phase 2 is done when: speed-to-lead is under 5 minutes, every sequence is live, and the Phase 1 dashboard shows the lift. Tracked targets: lead → inspection %, unsold-estimate recovery \$, and revenue per lead.

Phase 3: Outbound + split testing against current inbound (Weeks 7–13, then ongoing)

The hypotheses

We're not just testing copy. We're testing how commercial owners buy.

- **H1 (offer):** Commercial owners respond more readily to a risk-reduction conversation (maintenance plan) than to a capital-expense conversation (full reroof).
- **H2 (entry point):** A free condition report is a lower-friction way in that later converts to reroofs and maintenance contracts.
- **H3 (copy):** Personalized, proof-first angles (Loom, soft trigger) beat generic pitches in a small market where every contact matters.
- **H4 (channel):** For facilities and ops titles, LinkedIn produces fewer but better-qualified conversations than email.

Each round below confirms or rejects one of them.

The test grid

Offer (number) × Copy template (letter)

	A. Clear pitch	B. Lead magnet	C. Loom	D. Local contractor	E. Soft trigger
1. Full reroof	1A	1B	1C	1D	1E
2. Maintenance plan	2A	2B	2C	2D	2E

- **Offer 1: Full reroof.** A free condition report and written replacement plan/budget, leading to a reroof proposal.
- **Offer 2: Maintenance plan.** Two inspections a year, priority leak response, and a written report after each visit, leading to recurring revenue and first call on the eventual reroof.
- **A. Clear pitch:** say exactly what they get and ask.
- **B. Lead magnet:** give a useful 1-pager first.
- **C. Loom:** a 60–90 second personalized video of *their* building from aerial imagery.
- **D. Local contractor:** lead with being local since 2006, crews nearby, not a storm-chaser.
- **E. Soft trigger:** tie to something real about them: roof age, a recent sale, their budget season, a job nearby.

Naming convention: [Segment] - [Offer] [Copy] - [Channel]

Example: COM-2C-LI = Commercial, Maintenance plan, Loom, LinkedIn.

Segments: COM commercial · PM property managers/investors · HOA associations.

Channels: EM email · LI LinkedIn.

How we run it (small local market, so tests are staged)

Round	Weeks	Test	Held constant
1: Offer (H1)	7–8	1A vs 2A: reroof vs maintenance, same clear-pitch copy	Copy, segment (COM), channel
2: Copy (H3)	9–10	Current control × B, C, D, E (e.g. 2B / 2C / 2D / 2E)	Offer, segment, channel
3: Channel (H4)	11–12	Top 2 cells on EM vs LI	Offer + copy
4: Segment	13+	Current control on PM and HOA	Offer + copy + channel

Sample size: target about 150 contacts per cell where the addressable market supports it. In smaller segments, we use the largest clean sample available and read results as **directional**, not as statistical winners. The Bowling Green/Owensboro commercial market is small, so nobody gets hit by two different tests.

Scoring: leading vs. lagging indicators

Leading (read in weeks)	Lagging (read in months)
Delivery rate	Proposals sent
Positive reply rate	Proposal \$
Qualified conversations	Signed \$
Meetings booked / held	Gross profit
Condition reports completed	Sales-cycle length

Leading indicators decide which copy stays in the test. Lagging indicators decide which offer and segment get budget. Nothing gets killed for a slow commercial sales cycle.

Decision rules (leading indicators): under 1% positive replies → candidate for pause or rework. 1–3% → iterate and collect more data. Over 3% → candidate control for the next round.

Outbound vs. current inbound: the same scoreboard

Every channel gets measured with the Phase 1 KPIs, so outbound has to earn its budget like everything else.

Channel	Leads	CPL	Appointments	CPA	Signed	CAC	Avg ticket	LTV	LTV:CAC	Revenue / lead
Inbound: web/SEO										
Inbound: Google LSA/ads										
Inbound: HomeAdvisor/Angi										
Inbound: referrals										

Channel	Leads	CPL	Appointments	CPA	Signed	CAC	Avg ticket	LTV	LTV:CAC	Revenue / lead
Outbound: email (best cell)										
Outbound: LinkedIn (best cell)										

Commercial sales cycles run longer than residential. Outbound gets judged on pipeline \$ at Day 90 and on signed \$ at months 4–9.

Outbound compliance

A one-page Outbound Compliance SOP sits behind this plan and gets signed off before the first send. It covers:

- CAN-SPAM
- Applicable state rules
- TCPA where texts or calls are involved
- LinkedIn's terms and daily limits
- Opt-out handling within one business day (we do it within the hour)
- A suppression list shared across every tool
- Business contacts only for cold outreach, with consumers kept to opted-in channels
- Accurate sender identity
- **Truthful personalization:** property-record triggers are verified before use

The copy: email 1 for every cell (commercial)

Plain text, no links in email 1. Sent from a separate outbound domain so cmsroofing.com's email reputation is protected. Signed by Jaron.

1A: Reroof × Clear pitch

Subject: roof at {{property_address}}

Hi {{first_name}},

If the roof at {{company}} is getting close to replacement, we'll put together a free condition report and a written replacement plan: photos, how many years it has left, and what a reroof would cost so you can budget for it.

We're a Versico-certified commercial roofer in Bowling Green. Worth doing for your building?

2A: Maintenance × Clear pitch

Subject: roof maintenance at {{company}}

Hi {{first_name}},

Most flat roofs that need replacing early just missed small repairs. Our maintenance plan covers two inspections a year, priority leak response, and a written report after every visit, so your roof lasts as long as it should.

Would that be useful for {{company}}?

1B: Reroof × Lead magnet

Subject: flat roof replacement costs, 2027

Hi {{first_name}},

I put together a 1-page guide on what commercial reroofs actually cost in Kentucky right now, by roof type, plus the 4 signs a roof has 2–3 years left instead of 10.

Handy for next year's budget. Want me to send it?

2B: Maintenance × Lead magnet

Subject: 8 things that add years to a flat roof

Hi {{first_name}},

Made a short checklist of the 8 maintenance items that add the most life to a commercial roof. Most take less than an hour a year.

Want a copy for your facilities team?

1C: Reroof × Loom

Subject: video of your roof

Hi {{first_name}},

I pulled up {{company}}'s building on aerial imagery and recorded a 90-second video walking through what I'd look at before planning a replacement.

Mind if I send it over?

2C: Maintenance × Loom

Subject: quick video, {{company}} roof

Hi {{first_name}},

Recorded a short video of {{company}}'s roof from the aerial view, pointing out a couple of spots that usually need attention first on roofs like yours.

Want me to send it?

1D: Reroof × Local contractor

Subject: Bowling Green roofer, since 2006

Hi {{first_name}},

When it's time to replace a big roof, a lot of owners end up with out-of-town crews who are gone once the check clears. We've been in Bowling Green since 2006, our crews are right here in town, and we back our work with a 25-year workmanship warranty.

If a reroof is on your horizon at {{company}}, worth a conversation?

2D: Maintenance × Local contractor

Subject: a local roofer on call

Hi {{first_name}},

When {{company}}'s roof leaks, how fast can your roofer actually get there? We're local, with crews in Bowling Green and Owensboro, and our maintenance customers get priority response.

Open to hearing how it works?

1E: Reroof × Soft trigger

Subject: {{company}}'s roof, {{roof_age}} years in

Hi {{first_name}},

County records show {{company}}'s building went up around {{year_built}}. Most commercial roofs from that era are coming up on replacement, and the owners who plan a year ahead usually pay less than the ones who wait for a leak.

Want a free condition report so you know where yours stands?

Other real triggers to rotate in: budget season ("before next year's budget is set"), a recent building sale, a CMS job nearby ("we're finishing a roof on [real nearby street] this month"), or a documented storm date. Only use one if it's true.

2E: Maintenance × Soft trigger

Subject: before winter hits {{city}}

Hi {{first_name}},

Freeze-thaw season is when small flat-roof problems turn into leaks. We do a fall inspection and tune-up for buildings like {{company}}'s before the weather turns, and it's the first visit of our maintenance plan.

Want us to add you to the fall schedule?

Follow-ups (shared by every cell, same thread)

- **Email 2 (Day 4):** "Following up, {{first_name}}. Are roofs something you handle at {{company}}, or is there someone better to ask?"
- **Email 3 (Day 9):** One real result from a similar building, then "Worth a look at yours?"
- **Email 4 (Day 16, new thread):** A one-line question. "Who gets the call when the roof leaks at {{company}}?"
- **Email 5 (Day 21):** Breakup. "I'll stop here. If the roof becomes a priority, reply and we'll have a report to you within the week."

LinkedIn versions (same offer and letter, rewritten for LinkedIn)

- **Connection request (all cells):** "Hi {{first_name}}, I work with facilities folks around Bowling Green and Owensboro. Good to be connected." (*No pitch.*)
- **Message 1, after they accept:** the email 1 copy for that cell, cut to 2–3 sentences, ending in a question
- **Message 2 (Day 5):** "Did that land, {{first_name}}? Happy to send the [guide / video / report details] if it's useful."
- **Loom cells (C) on LinkedIn:** send the video link in message 1 when the video is already recorded. It gets watched far more often there than in cold email.

When someone says yes

Two specific times within minutes, a short qualifying call, contact on the second channel the same day, and a full handoff note to the closer. The pre-written answers to every reply type are in the Sequence System doc.

Timeline at a glance

Week	1	2	3	4	5	6	7	8	9	10	11	12	13
Phase 1: Data & KPIs	■	■	■	■									
Phase 2: Optimize + AI			■	■	■	■	■	■					
Phase 3 prep (domains, lists, Looms, LinkedIn page + Jaron's profile)					■	■							
Phase 3: Outbound tests							■	■	■	■	■	■	■

What I need from you

1. Access to the CRM/job software (or an export) and the phone/call-tracking system
2. Marketing spend by channel for the last 12 months
3. Job revenue and costs (or margin by job type)
4. Real pricing ranges for repairs, reroofs, and a maintenance plan (for the copy)
5. 2–3 real jobs we can reference (especially commercial), with photos

6. Sign-off on what a qualified buyer looks like for commercial, property managers, and HOAs
 7. **The business objective for the next 12 months**, so we optimize toward the right destination:
 - Revenue and gross-profit targets
 - Residential / commercial mix
 - Desired backlog
 - Geographic focus
 - Number of crews
 - The job types you most want more of
-

The short version: I'm not coming in to "do marketing." I'll build the measurement layer, find where revenue is leaking, fix the system you already have, and then prove whether outbound can become a second predictable revenue channel. It has to earn its place against the economics of your existing channels.
